INDUSTRIALIZED METHODS

Today, industrialized methods of construction are being countless. Everyday a new method, relatively speaking, is being known. Sources of information about them are infinite as well.

This did create a deadlock in starting the picking up process for those methods that might fit our local environment and conditions. However, contacts, either by mail, personal visits or through literature, have been made. But for the purpose of this research, we found that the most promising, efficient breakdown categorization of them all was made by the Department of Housing and Urban Development, U.S.A., for the Breakthrough Programme.

Still other agencies, and international institutions did provide information but not enough for our use.

A summary and a glossary of the categorization used followed by samples of the industrialized methods are in the coming pages.
